Wind Turbine Models IEC 61400-27-1

1. General

This document describes the usage of the wind turbine generator (WTG) by NEPLAN power systems analysis tools on the base of [1].

Four different types will be described by splitting in nine models. All parts of the dynamic models are listed in the following Tab. 1.

Block/Functionality	WT1A	WT1B	WT2	WT3A	WT31A	WT3B	WT4A	WT41A	WT4B
Generator System (Induction Gen.)	✓	✓	✓						
Generator System Type 3A				✓	✓				
Generator System Type 3B						✓			
Generator System Type 4							✓	✓	✓
Aerodynamic (Const. Aero Torque)	✓								
Aerodynamic (One-dimensional aero model)				✓		✓			
Aerodynamic (Two-dimensional aero model)					✓				
Control (P control type 3)				✓	✓	✓			
Control (P control type 4A)							✓	✓	
Control (P control type 4B)									✓
Control (Q control mode)				✓	✓	✓	✓	✓	✓
Constant Q limitation model				✓	✓	✓	✓	✓	✓
QP and QU limitation model								✓	
Control (Pitch control power model)		✓	✓						
Control (Pitch angle control model)				✓	✓	✓			
Control (Rotor resistance control model)			✓						
Mechanical (Two mass)	✓	✓	✓	✓	✓	✓			✓
Control (Current limitation model)				✓	✓	✓	✓	✓	✓
Reference frame rotation model				✓	✓	✓	✓	✓	✓
Grid Protection	✓	✓	✓	✓	✓	✓	✓	✓	✓

Tab. 1: CGMES Blocks/Functionalities Overview

2. Model Configuration

In this chapter the configuration of four different WT types with their correspondent models will be described for the dynamic test systems.

2.1. Type 1

The WT type 1 (Fig. 1) is described by an asynchronous generator directly connected to the grid (without power converter). There are two subtypes, WT1A and WT1B: WT1A includes a fixed pitch angle, WT1B includes UVRT pitch angle control.

Fig. 1: Main electrical and mechanical components of type 1 WTs [1].

The NEPLAN system descriptions are in Fig. 2 and Fig. 4, respectively for WT1A and WT1B, some results are shown in Fig. 3 and Fig. 5.

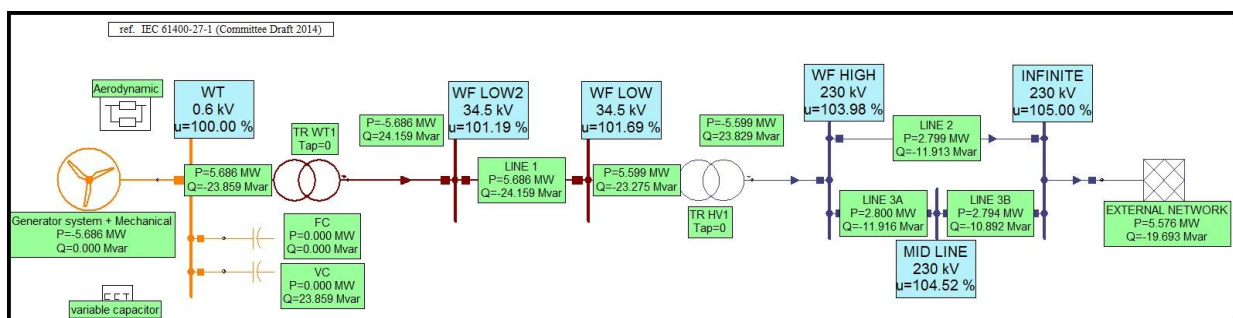

Fig. 2: System description WT1A

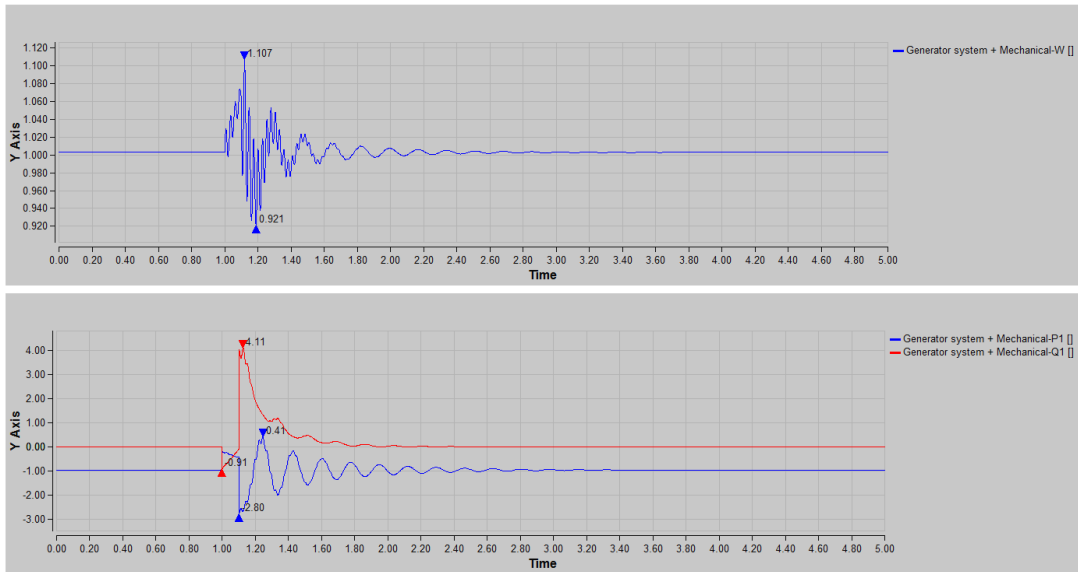

Fig. 3: Some results by WT1A simulation

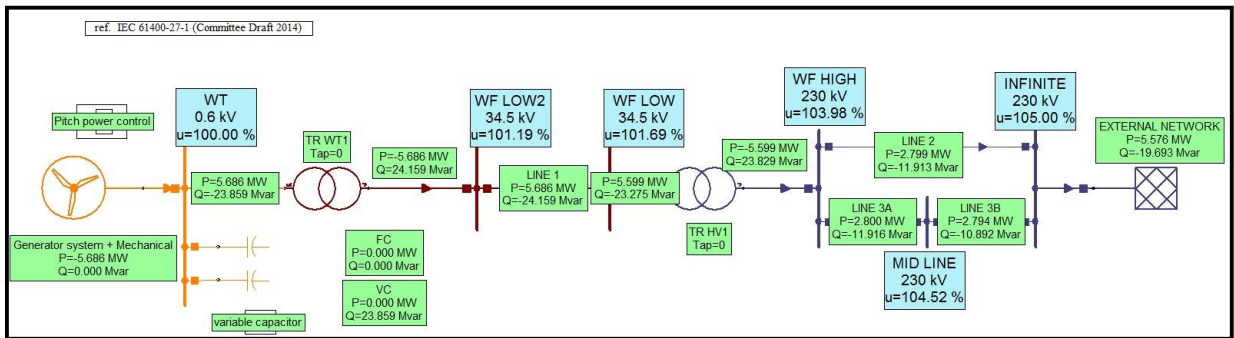

Fig. 4: System description WT1B

Fig. 5: Some results by WT1B simulation

Output variables for **RESULTS of WT1A** from Fig. 6:

- Active and reactive power of generator system;
- P_aereo;
- Generator speed (Wgen) and Mechanical speed (WTR).

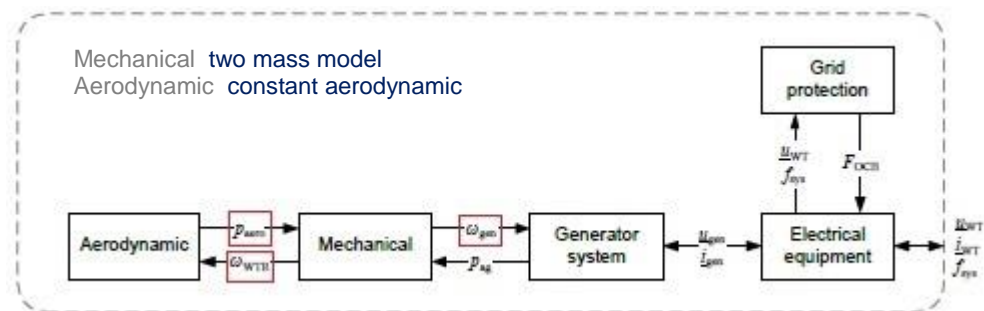

Fig. 6: Modular structure for the type 1A WT model [1].

Output variables for **RESULTS of WT1B** from Fig. 7:

- Active and reactive power of generator system;
- Pitch control power;
- Generator speed (Wgen) and Mechanical speed (WTR).

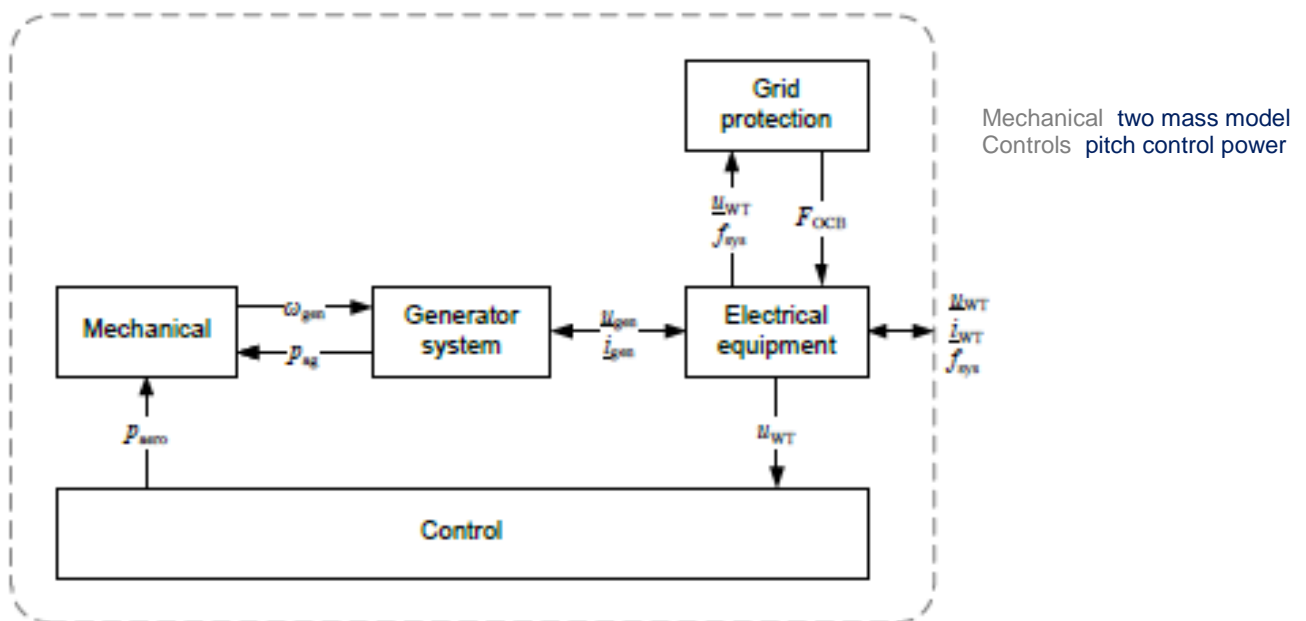

Fig. 7: Modular structure for the type 1B WT model [1].

2.2. Type 2

The type 2 WT is similar to a type 1 WT in many aspects. In type 2 the turbine is equipped with a variable rotor resistance (VRR) and normally with pitch power control, it is shown in Fig. 8.

Fig. 8: Main electrical and mechanical components of type 2 WTs [1].

The NEPLAN system is shown in Fig. 9 and some results are shown in Fig. 10.

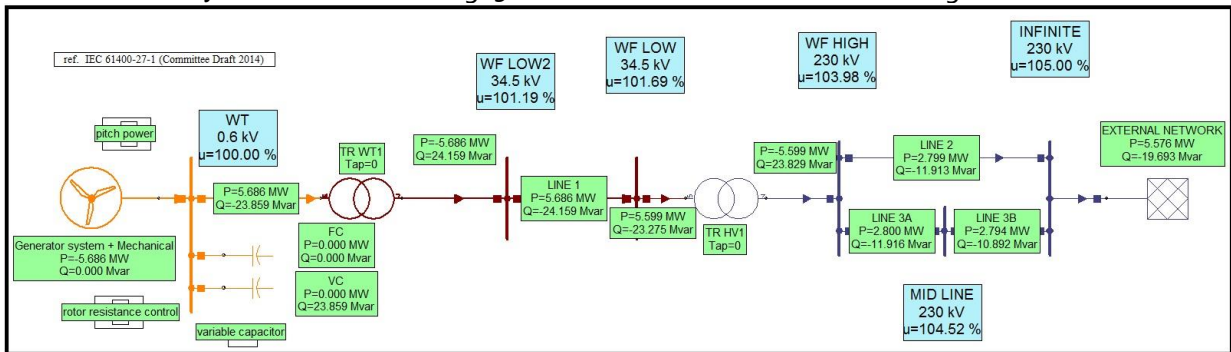

Fig. 9: System description type 2 WT

Fig. 10: Some results by WT2 simulation.

Output variables for **RESULTS of WT2** from Fig. 11:

- Active and reactive power of generator system;
- Pitch control power;
- Generator speed (ω_{gen}) and Mechanical speed (ω_{tr});
- Rotor resistance control (r_{rot}).

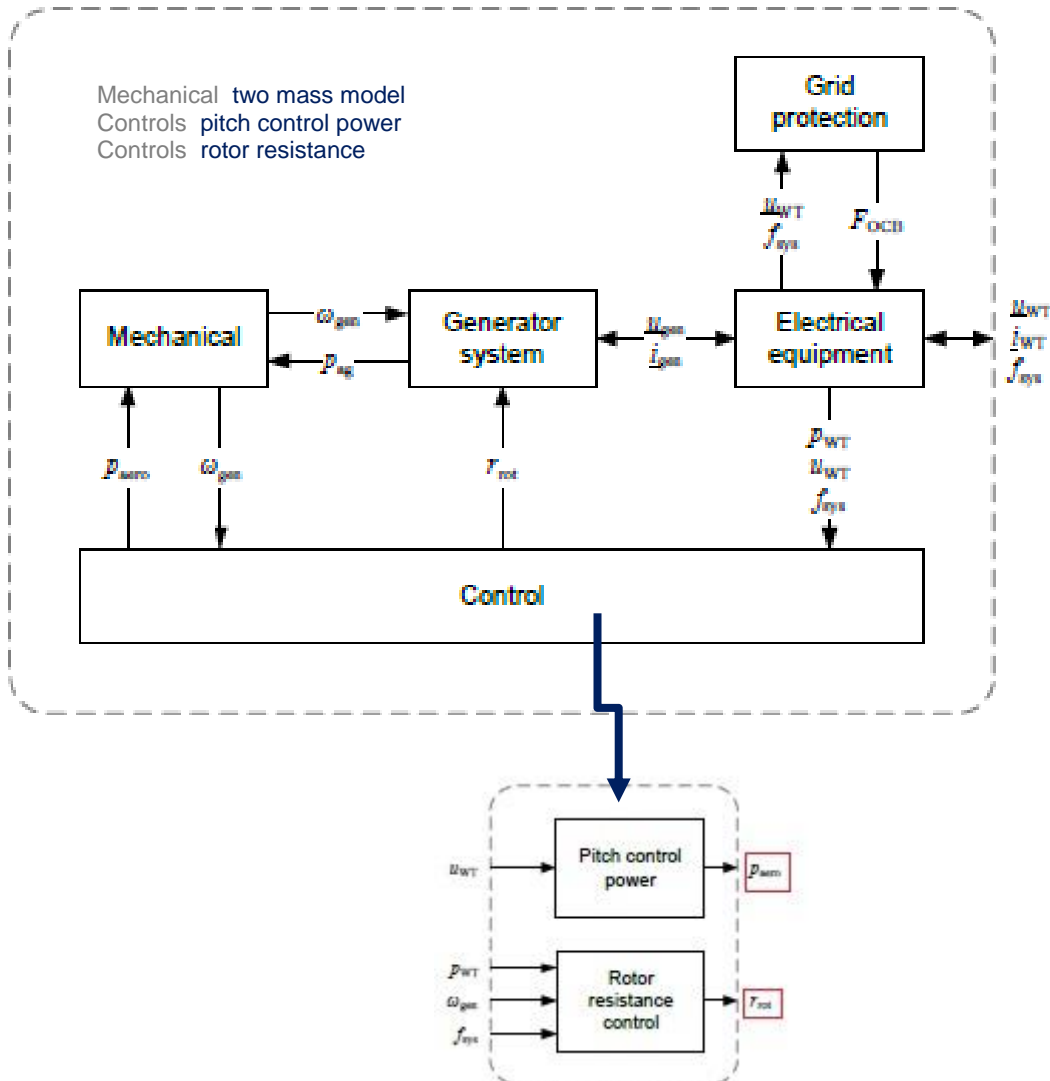

Fig. 11: Modular structure for the type 2 WT model [1].

2.3. Type 3

The type 3 WT (Fig. 12) uses a doubly fed asynchronous generator (DFAG), where the stator is directly connected to the grid and the rotor is connected through a back-to-back power converter. There are two subtypes, WT3a and WT3b: WT3a is without crowbar protection, WT3b is with crowbar protection.

Fig. 12: Main electrical and mechanical components of type 3 WTs [1].

For type WT3a two different cases are considered, WT3A and WT31A. The difference is in the aerodynamic torque model: WT3A includes one dimensional aerodynamic model, WT31A the two dimensional one.

The NEPLAN systems are shown in Fig. 13 and Fig. 14 respectively for WT3A and WT31A. Some results are shown in Fig. 15.

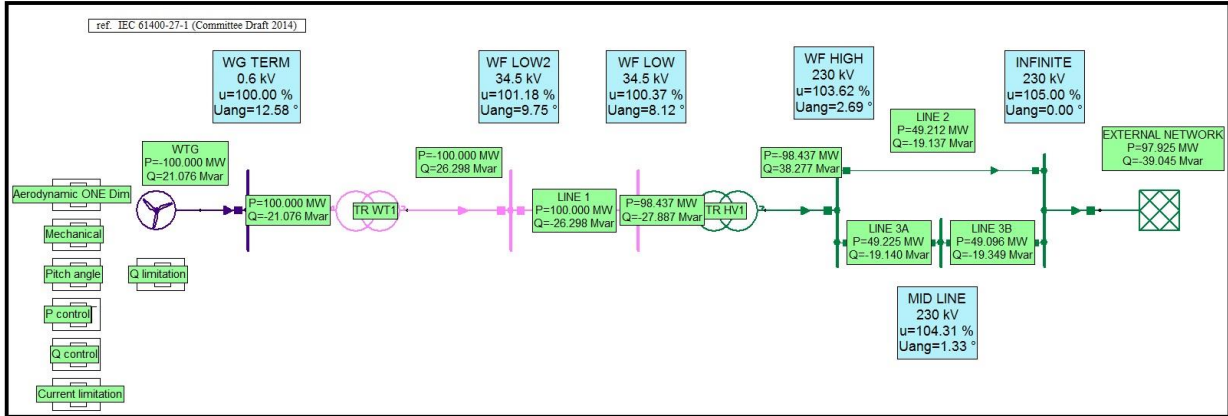

Fig. 13: System description type 3A WT.

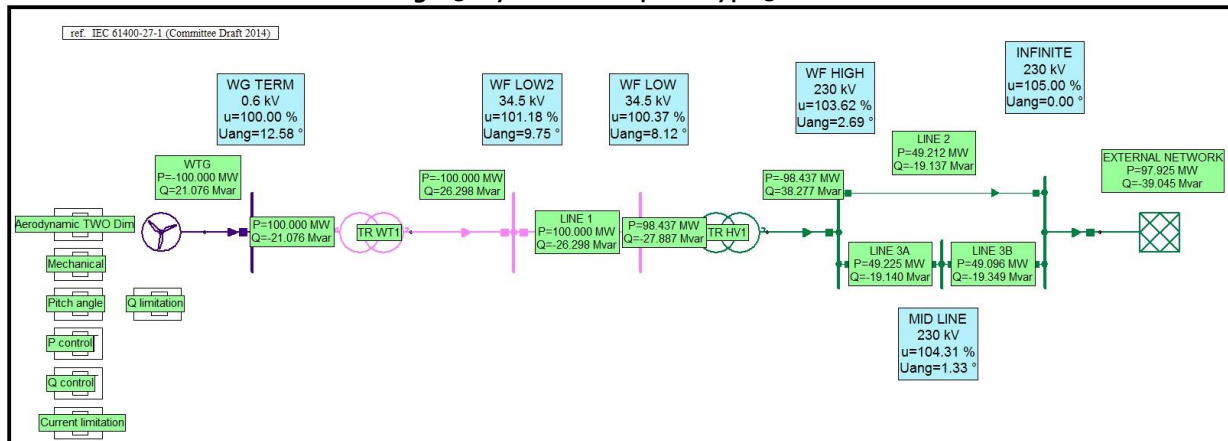

Fig. 14: System description type 31A WT.

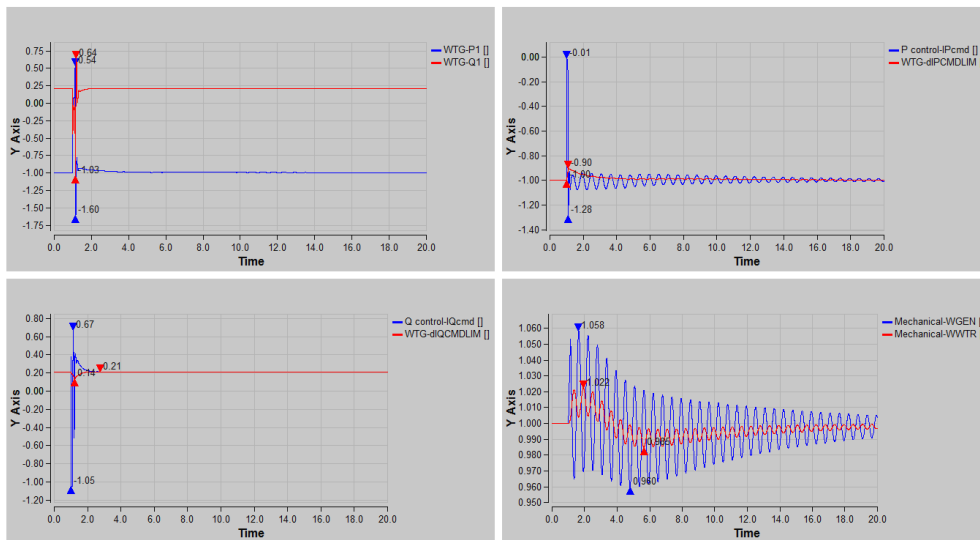

Fig. 15: Some results by WT3A simulation.

The NEPLAN system of type WT3B is shown in Fig. 16 and some results are shown in Fig. 17.

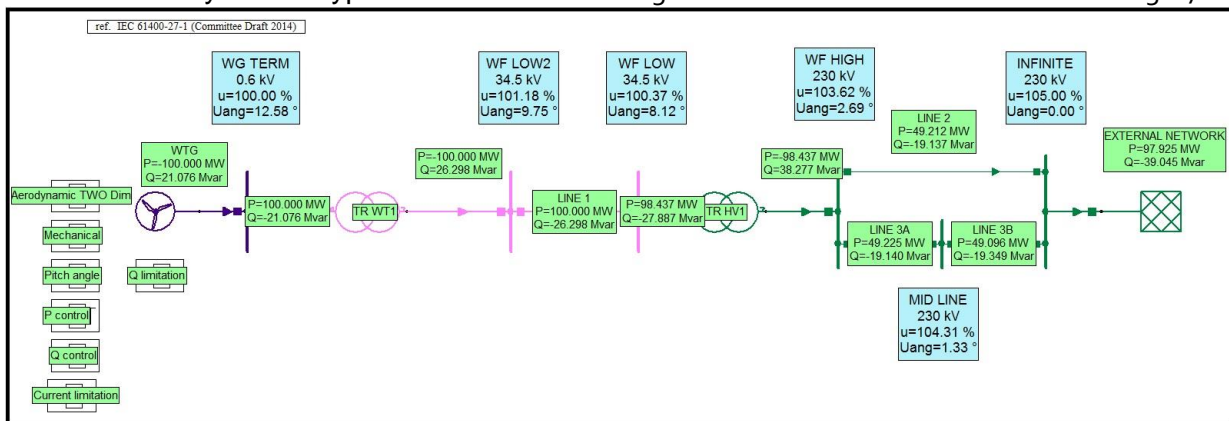

Fig. 16: System description type 3b WT.

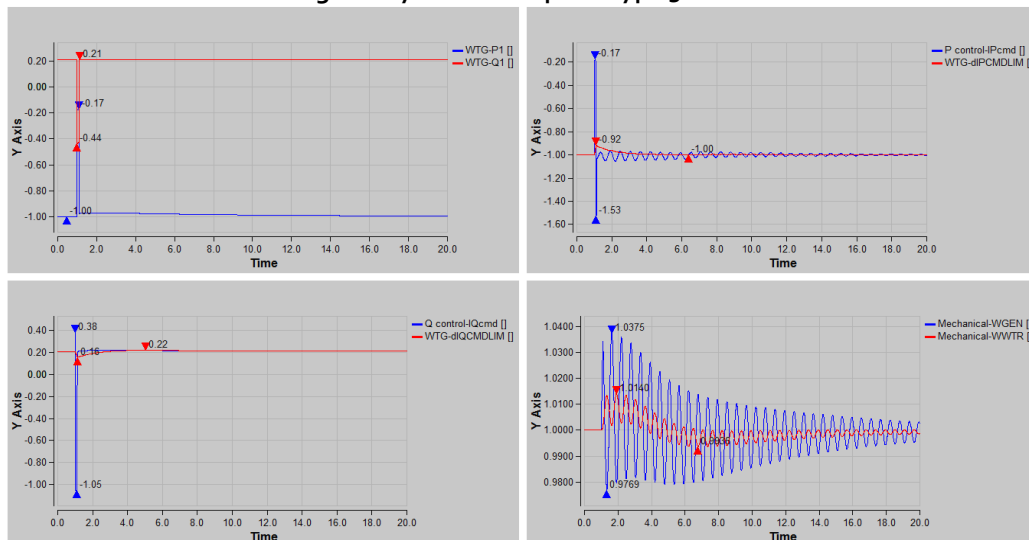

Fig. 17: Some results by WT3B simulation.

Output variables for **RESULTS of WT3a** from Fig. 18 and Fig. 19 :

- Active and reactive power of generator system;
- Aerodynamic one dimension (P_{aero});
- pitch angle (Θ);
- Generator speed (ω_{gen}) and Mechanical speed (ω_{WTR});
- Active power control (I_{pcmd} and I_{qcmd}).

Output variables for **RESULTS of WT31a** from Fig. 18 and Fig. 19 :

- Active and reactive power of generator system;
- Aerodynamic two dimension (P_{aero});
- Pitch angle (Θ);
- Generator speed (ω_{gen}) and Mechanical speed (ω_{WTR});
- Active power control (I_{pcmd} and I_{qcmd}).

Output variables for **RESULTS of WT3b** from Fig. 18 and Fig. 19 :

- Active and reactive power of generator system;
- Aerodynamic one dimension (P_{aero});
- Pitch angle (Θ);
- Generator speed (ω_{gen}) and Mechanical speed (ω_{WTR});
- Active power control (I_{pcmd} and I_{qcmd}).

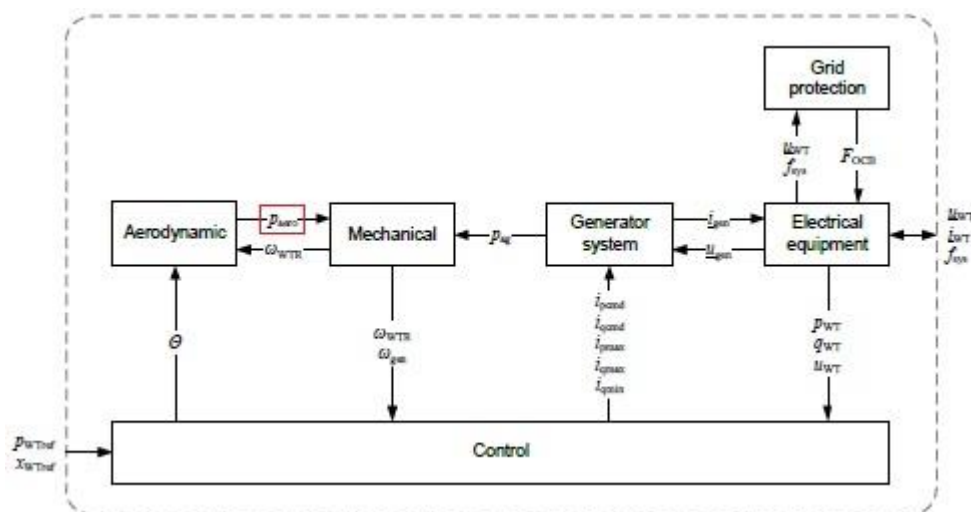

Fig. 18: Modular structure for the type 3 WT model [1].

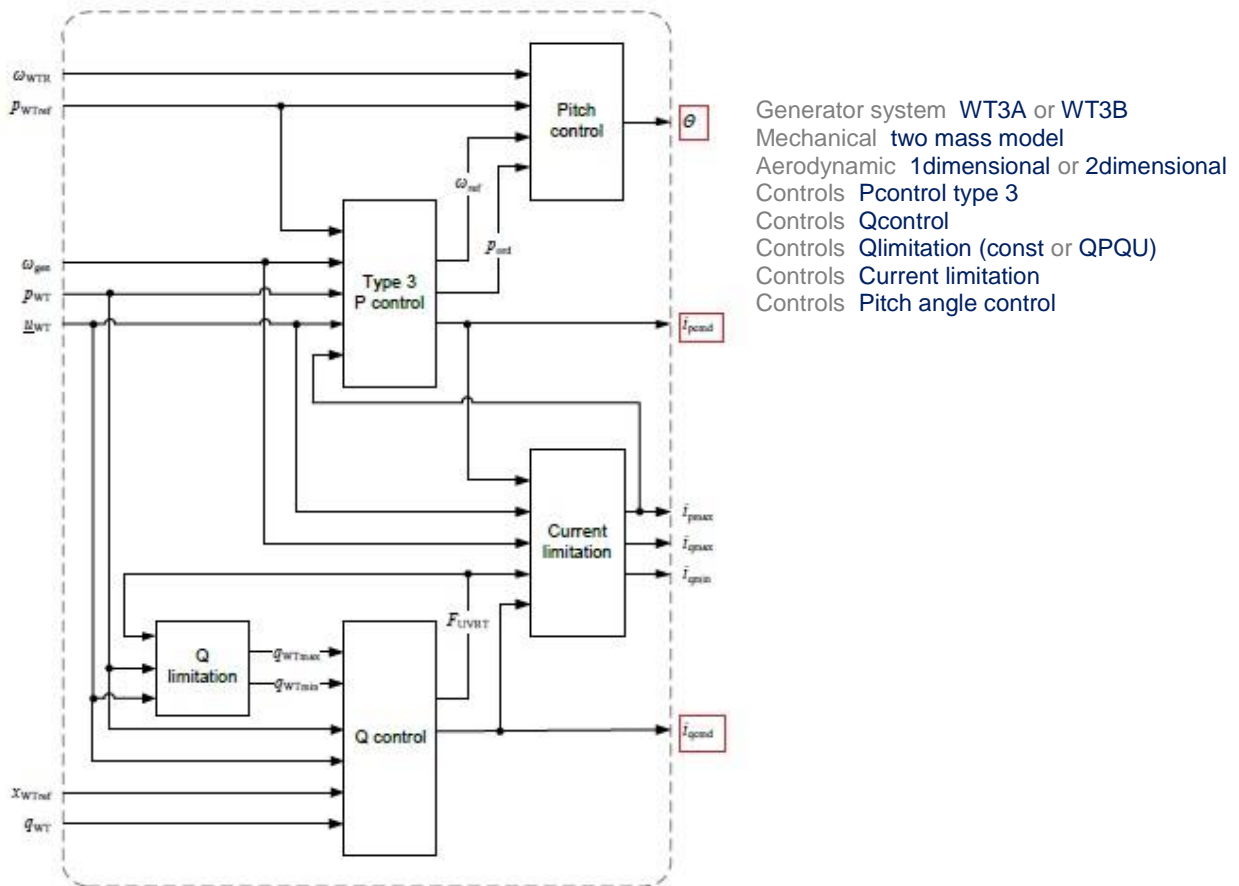

Fig. 19: Modular structure for the type 3 WT control model [1].

2.4. Type 4

The WT type 4 (Fig. 20) uses either synchronous generators or asynchronous generators, and they are connected to the grid through a full scale power converter. There are two subtypes, WT4a and WT4b: in WT4a the aerodynamic and mechanical parts are neglected, in WT4b the two mass mechanical model is included, but assuming constant aerodynamic torque.

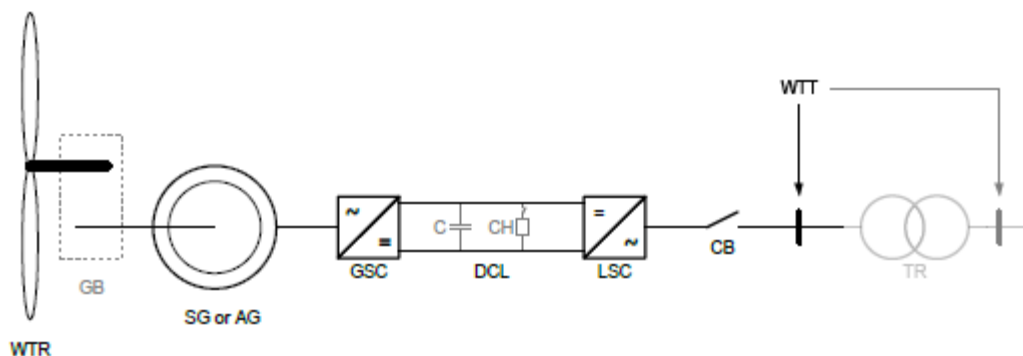

Fig. 20: Main electrical and mechanical components of type 4 WTs [1].

For type WT4A two different cases are considered, WT4A and WT41A. The difference is in the Q limitation control: WT4A uses constant Q limitation control, WT41A the QPQU Q limitation control.

The NEPLAN systems are shown in Fig. 21 and Fig. 22 respectively for WT4A and WT41A. Some results are shown in Fig. 23.

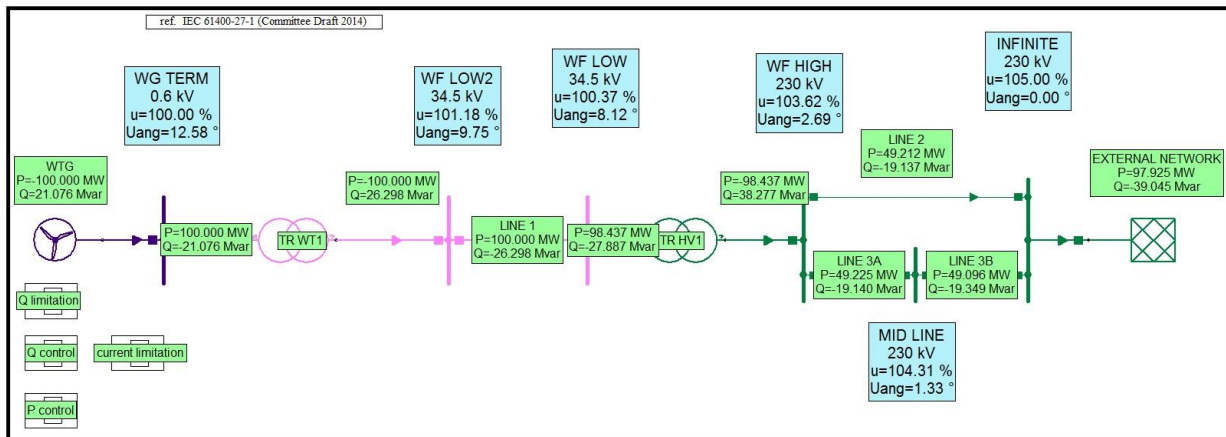

Fig. 21: System description type 4A WT.

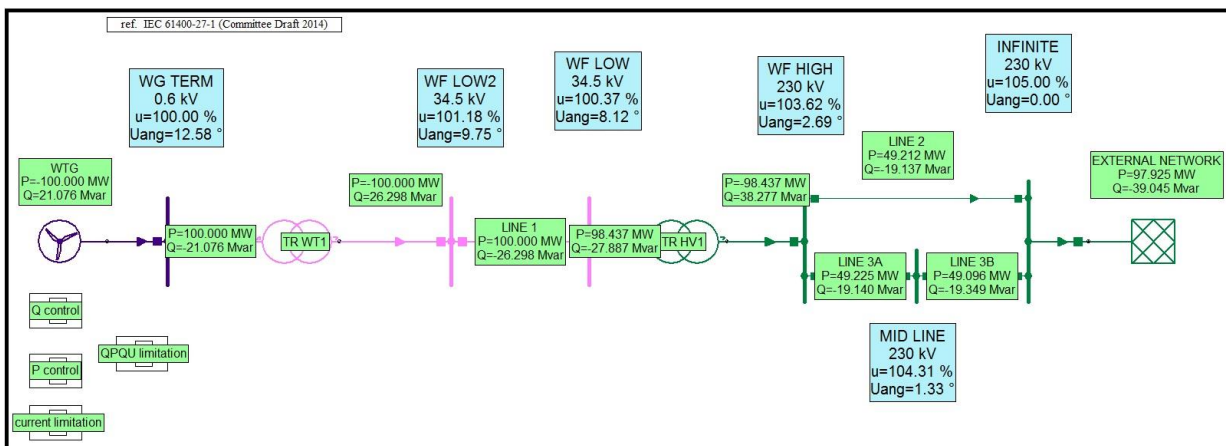

Fig. 22: System description type 41A WT.

Fig. 23: Some results by WT4A simulation.

The NEPLAN system of type WT4B is shown in Fig. 24 and some results are shown in Fig. 25.

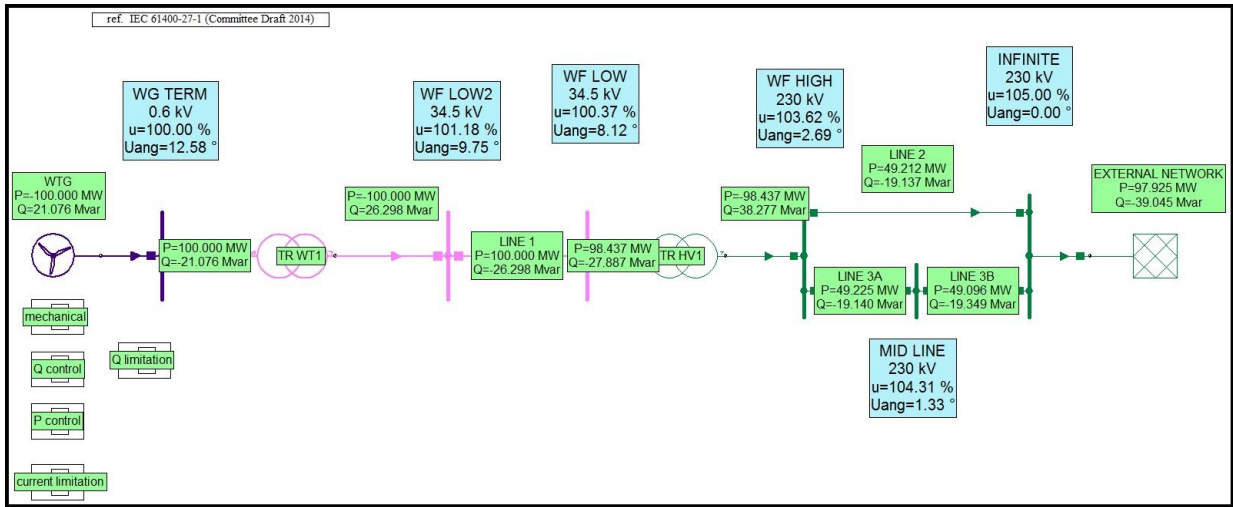

Fig. 24: System description type 4B WT.

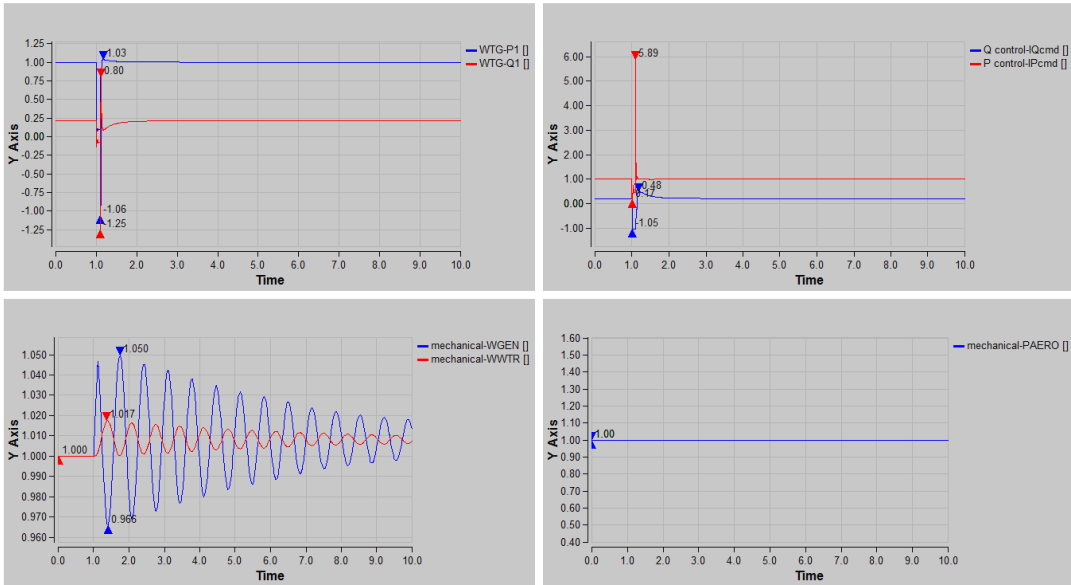

Fig. 25: Some results by WT4B simulation.

Output variables for **RESULTS of WT4a** from Fig. 26 and Fig. 27:

- Active and reactive power of electrical equipment;
- Reactive power limitation control output (QWTmax and QWTmin);
- Active power control (Ipcmd and Iqcmd).

Output variables for **RESULTS of WT41a** from Fig. 26 and Fig. 27:

- Active and reactive power of electrical equipment;
- QPQU limitation control output (QWTmax and QWTmin);
- Active power control (Ipcmd and Iqcmd).

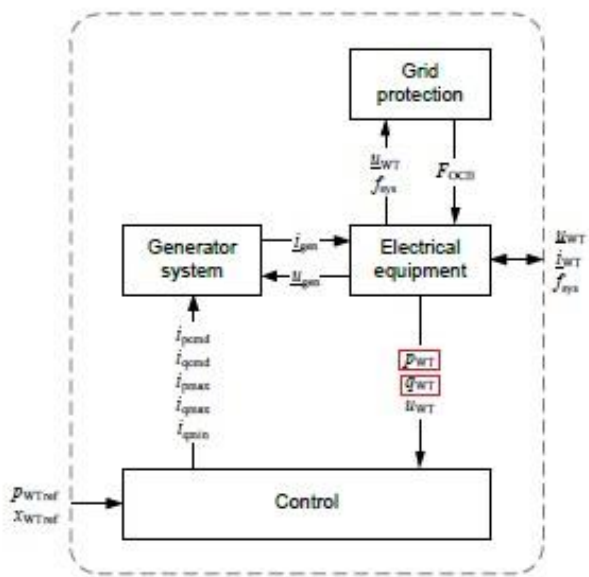

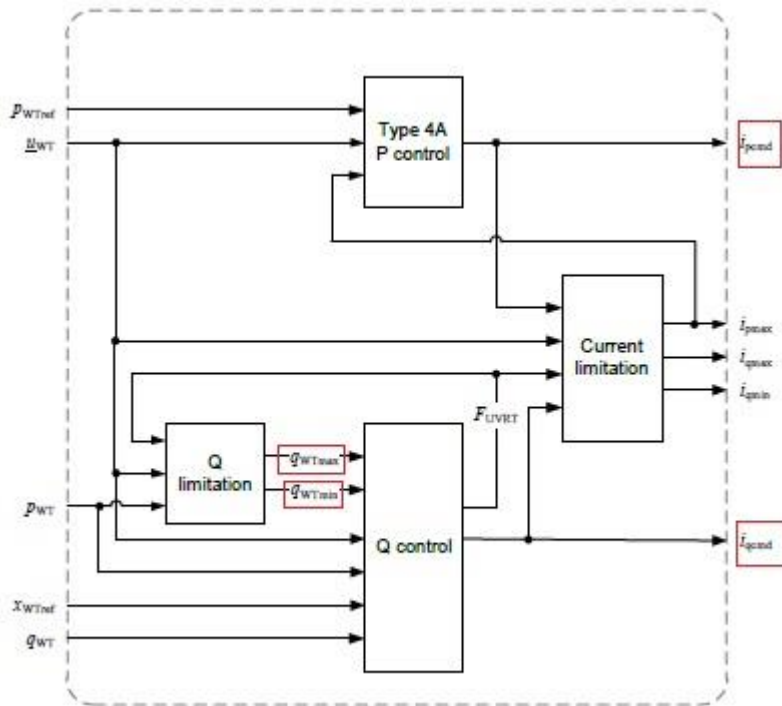

Fig. 26: Modular structure for the type 4a WT model [1].

Generator system WT4
 Controls P control type 4A
 Controls Q control
 Controls Q limitation (const or QPQU)
 Controls Current limitation

Fig. 27: Modular structure for the type 4a control model [1].

Output variables for **RESULTS of WT4b** from Fig. 28 and Fig. 29:

- Active and reactive power of electrical equipment,
- P_aero,
- Generator speed (Wgen) and mechanical speed (WTR),
- Active power control (Ipcmd and Iqcmd)

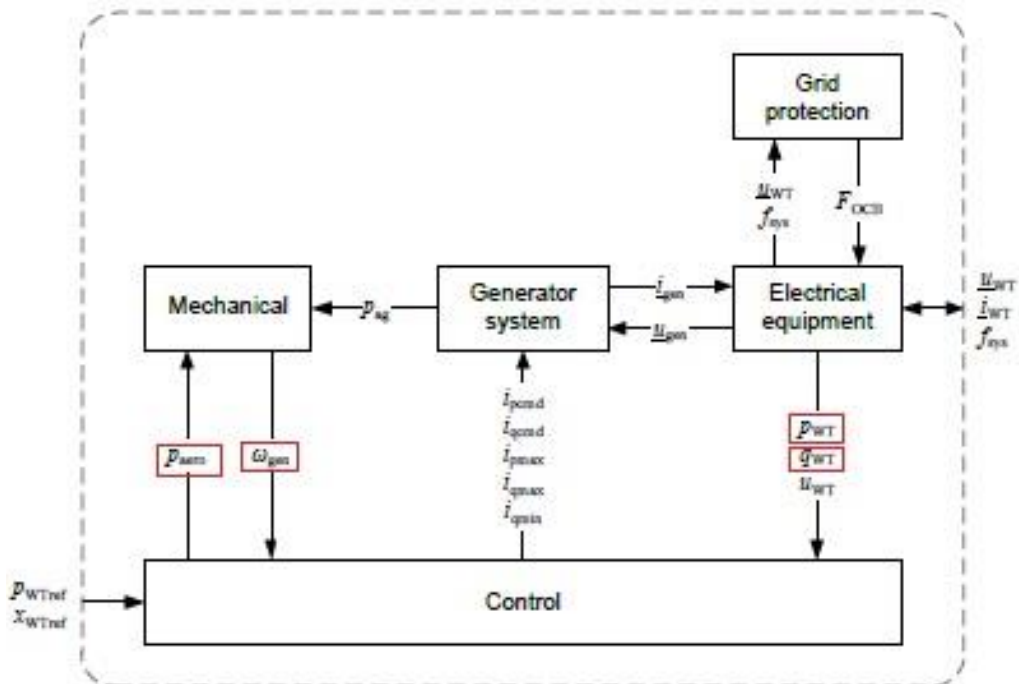

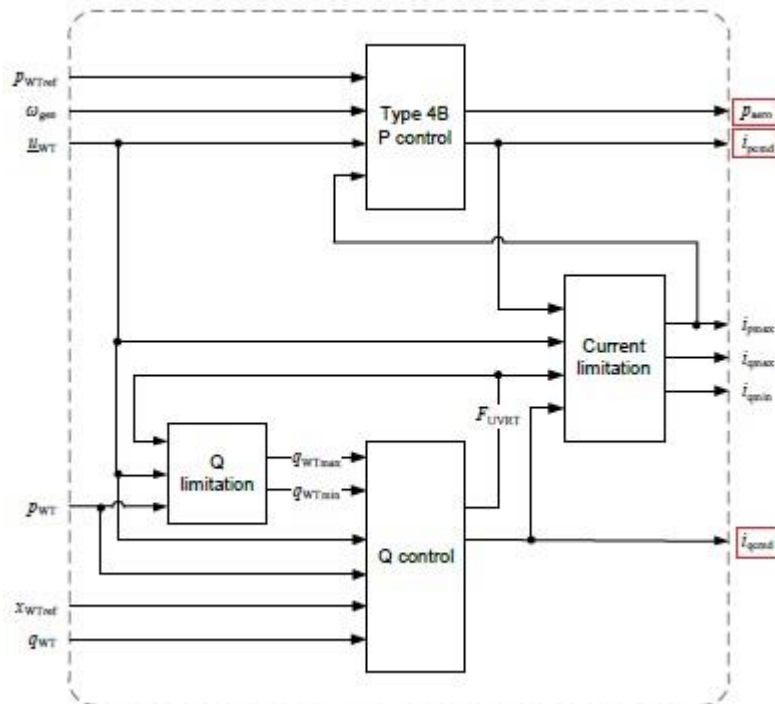

Fig. 28: Modular structure for the type 4b WT model [1].

APPENDIX A , INPUT of Blocks/Functionalities

A1. Parameters for WT type 1A

In this paragraph the input parameters of Blocks/Functionalities for the WT type 1A are indicated to simulate the WG27, IEC 61400-27-1 systems by using NEPLAN software tool. The following input parameters in Tab. 2 are used also for Type 1B.

Mechanical Two mass	
cdrt	1.5
hgen	0.0625
hwtr	0.4375
kdr	17.27

Tab. 2: Values of Mechanical (Two mass) parameters for WT type 1.

A2. Parameters for WT type 1B

The input parameters used for the Type 1B are equal than previous ones of WT Type 1A (paragraph A1). Only the following input parameter values (Tab.3) and its "WindLookupTableFunctionKind" (Tab. 4) are different:

Pitch control power	
dpmax	100
dpmin	-100
